Hybrid OR imaging solutions

Perfecting minimally invasive surgery with procedural intelligence

siemens-healthineers.com/hybrid-or
Demand exceeds supply: a growing dilemma for hospitals

Many hospitals today face staff shortages, limiting their ability to provide optimal treatment in every situation. Innovative solutions that reduce the workload per patient can help alleviate this problem.

Not enough new staff available for vacancies

2014
Vacancy rates 13–18%

2025
Vacancy rates 30%

In 2014, the U.S. healthcare system already faced a vacancy rate of 13–18%\(^1\) – and this number is expected to double by 2025.\(^2\)

Understaffing may affect patient outcomes

2010
Readmission rate plus 41%

2017

From 2010 to 2017, the number of UK patients who were readmitted to the hospital for potentially preventable conditions rose by 41%.\(^3\) Inadequate quality of care due to workforce limitations may help explain this sudden increase.
Hybrid OR imaging solutions

Perfecting minimally invasive surgery with procedural intelligence

Offering standardized minimally invasive treatment for any patient is crucial for healthcare institutions. However, time-consuming manual workflows, unwanted variations in procedural outcomes, and staff training needs stand in the way. To overcome these barriers, we have equipped our latest generation of fixed C-arms with procedural intelligence: a unique combination of imaging and workflow software that helps optimize clinical operations in the Hybrid OR.

Procedural intelligence brings consistency to your surgical workflows by eliminating cumbersome and repetitive manual input steps. You only have to select custom parameters for every procedure step one time, and then the system will set them automatically for every treatment thereafter. With step-by-step intra-operative guidance, intelligent optimization of image quality and dose, and automated C-arm positioning, our imaging systems with procedural intelligence enable standardized image-guided surgery, regardless of procedural complexity.

Optimize clinical operations with procedural intelligence

Wasteful activities account for up to 47% of U.S. healthcare costs per year.

Healthcare has a technical potential for automation of about 36%.

Interventional fluoroscopy is used for more than 10 million procedures every year.

Wasted OR time and resources

Almost half of U.S. healthcare expenditures every year go toward tasks that are completely unnecessary from a resource management perspective. A prime example is the multitude of manual steps that medical professionals currently perform as part of surgical imaging workflows.

Limited automation despite massive potential

Lost productivity goes beyond unnecessary manual steps during treatment planning. Approximately 36% of all healthcare activities could be automated, and this includes complex tasks such as data analyses of pre-procedural CT images that software solutions can complete quickly and efficiently.

Excessive staff radiation exposure

Intraprocedural imaging helps improve treatment for many patients groups— but it also leads to health consequences for medical professionals as a result of frequent radiation exposure. Case in point: interventional fluoroscopy is used for more than 10 million procedures every year, and practitioners are being diagnosed with brain tumors at alarming rates.
Procedural intelligence helps simplify and standardize your imaging workflows, so that you can provide the best possible treatment for every patient.

**Surgical imaging with fewer manual steps**

Customize our predefined Case Flows based on your needs to ensure precise intra-operative guidance and excellent clinical outcomes. The next time you recall the same Case Flow, the system will automatically apply your chosen parameters.

**Intelligent analysis of pre-operative 3D data**

Use our dedicated software to guide preparation for surgical procedures. The algorithms will automatically visualize the target along with relevant anatomical landmarks for precise intra-operative guidance.

**Standardized image quality at ALARA dose**

Select your preferred image quality level for the anatomy, devices, or materials you need to visualize. Using self-adjusting algorithms, our OPTIQ software will select the right imaging parameters while keeping the radiation exposure to a minimum for the OR team and the patient.

Define optimal parameters and eliminate up to 6 manual system interactions for every Case Flow step.

Procedural intelligence reduces preparation time from typically fifteen minutes to just one minute thanks to automated data processing for EVAR procedures.

In arteriovenous malformation treatment with material containing tantalum, for example, the dose can be reduced from 0.15 μGy·m⁻²/f to 0.026 μGy·m⁻²/f at the same device visibility.²

---

² Up to 50% less dose for DSA and fluoroscopy

---

² Up to 93% less manual interaction

---

² Up to 83% faster data analysis

---
Perfecting EVAR with procedural intelligence

Procedural intelligence helps you speed up your endovascular procedures. With intra-operative software guidance, intelligent optimization of image quality and dose, and automated C-arm positioning, even complex cases are greatly simplified. You can also standardize every workflow step thanks to EVAR Case Flow.

**Define optimal parameters for every Case Flow step**

Customize parameters for each procedure step and then save all settings to perform future treatments with the identical parameters.

**Optimal preparation of CT data**
Use software for assisted segmentation of important vessels, visualization of centerlines and ostia rings, and identification of landing zones as you get ready for fusion imaging.

**Fast registration for fusion imaging**
Quickly align the dataset with your angio system based on anatomical landmarks, using only your tableside controls.
“ARTIS pheno with syngo EVAR Guidance enables us to treat our patients with less radiation exposure, faster and more efficiently. Especially complex procedures like fenestrated stent grafts or TEVAR procedures are extremely simplified.”

Dr. med. Frank Marquardt | Rotes Kreuz Krankenhaus, Bremen, Germany

Review the clinical evidence

EVAR treatment in itself can lower complication rates\(^8\) and even reduce the risk of mortality compared to open surgery.\(^9\) Using fusion imaging – a core component of procedural intelligence – unlocks additional benefits for you and your patients.

- **30% shorter procedure time\(^{10}\)**
  Fusion imaging provides continuous 3D guidance throughout the whole procedure.

- **57% less iodine contrast media\(^{11}\)**
  Fusion imaging provides continuous guidance and reduces the amount of contrast media.

Cardiac surgery

Perfecting TAVI with procedural intelligence

Procedural intelligence helps you improve valve positioning. With intra-operative guidance software, intelligent optimization of image quality and dose, and automated C-arm positioning, treatment is greatly simplified. You can also standardize every workflow step thanks to TAVI Case Flow.

Define optimal parameters for every Case Flow step

Acquisition

Intra-operative syngo DynaCT or registration with pre-operative CT
Acquire high quality intra-operative 3D images of the aortic arch in less than five seconds with minimal contrast media with syngo DynaCT.

Planning

Automatic segmentation and indication of anatomical landmarks
Use automatic segmentation to identify key anatomical landmarks, and move the C-arm into position with a single push of a button.

Customize parameters for each procedure step and then save all settings to perform future treatments with the identical parameters.
“With multi-modal imaging, innovative imaging chains, image fusion and different post-processing technologies in one system, we can manage more complex cases faster and less invasively.”

Prof. Bernhard Schieffer, MD | University Hospital Marburg, Germany

**Deployment Verification**

Superimposition on live fluoro and guidance during valve deployment
Rely on intra-operative fusion imaging to guide you during valve deployment without using additional contrast media.

Immediate verification of valve positioning
Review the valve deployment right away at the table to prevent paravalvular leaks and early reinterventions.

Review the clinical evidence

TAVI procedures allow minimally invasive treatment of patients with severe symptomatic aortic stenosis. Here are some of the key benefits you stand to gain by using our imaging systems equipped with procedural intelligence.

**Double the quality of valve positioning**

Using our assisted workflow with intra-operative guidance may help increase the quality of valve positioning and reduce the amount of contrast media necessary, potentially improving treatment of patients with comorbidities and renal insufficiency.

**Impact on patient**

Studies show that the absence of paravalvular leaks are linked to better 3-year survival rates. Since our workflow optimizes valve positioning, it helps to improve outcomes.

ARTIS icono floor

An icon of innovation for cardiovascular procedures

Offering endovascular procedures significantly expands your cardiovascular treatment options. With ARTIS icono floor, this step is easier than ever before. The fully motorized C-arm system is equipped with procedural intelligence to help you standardize workflows for high-volume procedures and guide you through even the most complex cases to optimize clinical operations. Moreover, the small footprint makes ARTIS icono floor a perfect match for every existing OR.

Procedural intelligence benefits

- Surgical imaging with fewer manual steps
- Intelligent analysis of pre-operative 3D data
- Standardized image quality at ALARA dose

28m² minimum room size

86 cm clearance
SID*: 120 cm
6.18 m

source to imager distance
Minimal space requirements

Offering exceptional position flexibility but small enough to fit into a 28 m² room. ARTIS icono floor brings Hybrid OR performance to your existing ORs.

Motorized C-arm movements

The multiaxis floor stand with fully motorized movements provides full patient coverage (2.10 m) without the need for repositioning the patient.

Fast 3D scan times from head side

Intraprocedural 3D imaging from head side with short scan times and exceptional soft-tissue resolution allow you to perform any cardiovascular procedure.

Free ceiling above the patient

The system can be installed in most conventional operating rooms, with no special requirements for ceiling and floor. Thanks to the free ceiling above the operating field, sterile airflow during imaging is not interrupted.

Advanced infection control

The seamless exterior with smooth surfaces and antimicrobial paint acts as a safeguard against spills and permits easy cleaning. This passive infection control support simplifies regular cleaning and disinfection efforts.

ARTIS pheno

Cutting-edge robotic imaging for multidisciplinary utilization

Investing in a cutting-edge Hybrid OR prepares you for treating any patient regardless of the condition. ARTIS pheno – the only robotic C-arm system on the market – brings true multidisciplinary capabilities to your institution, enabling minimally invasive treatment across all specialties for maximum room utilization. Thanks to procedural Intelligence, ARTIS pheno provides all the support you may need to standardize your workflows for even the most complex cases to optimize clinical operations.

100% room utilization

Procedural intelligence benefits

- Surgical imaging with fewer manual steps
- Intelligent analysis of pre-operative 3D data
- Standardized image quality at ALARA dose
**Extended park positions**

The robotic C-arm permits fast and easy switching between surgical tasks and imaging and can even be parked with the push of a single button, giving you unmatched positioning flexibility.

**Flexible isocenter**

The flexible isocenter permits high-quality 2D and 3D imaging regardless of patient positioning. The working height can also be adjusted easily for improved comfort.

**Large-volume 3D scanning**

syngo DynaCT Large Volume lets you visualize up to ten vertebrae simultaneously and also offers coverage of the entire thorax or abdomen with a diameter of 43 cm.

**Third-party surgical table integration**

Multiple surgical disciplines can share a single Hybrid OR suite thanks to complex patient positioning support for any procedure. The robotic C-arm and full integration of third-party surgical tables with segmented tabletops makes it possible.

**Wide-space C-arm**

With its unique usable clearance of 95.5 cm (37.5"), the wide-space C-arm provides ample space around the patient, making it easier to ensure safe conditions for treatment while working with long devices and instruments and accommodating larger patients.

**Advanced infection control**

The seamless exterior with smooth surfaces and antimicrobial paint acts as a safeguard against spills and permits easy cleaning. This passive infection control support simplifies regular cleaning and disinfection efforts.
ARTIS pheno

Perfecting minimally invasive surgery – no matter which procedure
Therapy challenges
Lung cancer screenings enable physicians to discover tumors at an early stage. If the lesions are small and deep, minimally invasive surgery can prove challenging. CT-based needle localization in the interventional suite followed by transfer to the OR potentially carries the risk of needle dislocation, hemorrhage, and pneumothorax in an environment that is less safe than the OR.

Our solution: always on target
ARTIS pheno installed in a Hybrid OR offers a one-stop workflow and a set of dedicated features for the resection of small pulmonary nodules to help you master these challenges. The image-guided, video-assisted thoracoscopic surgery (iVATS) workflow combines intra-operative large-volume 3D imaging and laser-guided needle localization, followed by minimally invasive surgery. With ARTIS pheno, thoracic surgeons can optimize clinical operations by reducing the overall procedure time and the time-at-risk for the patient.

ARTIS pheno highlights
• syngo DynaCT Large Volume for visualizing the whole thorax – including skin – in 3D, enabling the planning of long transthoracic or endobronchial pathways
• Wide-space C-arm for collision-free rotation – even with large patients in lateral decubitus position – along with comfortable ergonomics for the surgeon
• syngo Needle Guidance for planning transthoracic trajectories to multiple lesions

Therapy challenges
Reliable technology that makes spine procedures safer, more accurate, and more efficient is crucial for the future of surgery. Precise image guidance and excellent intra-operative 3D imaging help minimize the risk of complications and increase patient safety. However, studies show that, depending on the method of guidance, the misplacement rate for pedicle screws can approach 15%.
And, spine revision surgery can be very costly: in some countries, $25,000 is to be expected.

Our solution: speed, precision, less repetition
ARTIS pheno provides individualized pre-operative planning, intraoperative guidance, and immediate post-operative quality control for spinal fusion. With syngo Needle Guidance, surgeons can plan and place pedicle screws precisely without the help of a navigation system. Studies show that using intra-operative image guidance during spinal fusion can reduce revision rates to about 1%. ARTIS pheno can be used to visualize more than ten vertebrae simultaneously in 3D with syngo DynaCT. The wide-space C-arm allows safe and efficient screw insertion using live image guidance and provides ample space for the surgeon.

ARTIS pheno highlights
- syngo DynaCT Large Volume for visualizing more than ten vertebrae in a single 3D scan
- syngo Needle Guidance for planning and guiding multiple pedicle screw paths
- Wide-space C-arm for comfortable and safe screw insertion using live image guidance
- Integration of third-party surgical tables, head clamps, and navigation systems
Neurosurgery

Perfecting deep brain stimulation with procedural intelligence

Therapy challenges
Conventional approaches to deep brain stimulation rely on pre-operative 3D images from MR fused with CT which do not offer live image guidance during the actual implantation of the electrodes in the OR. Furthermore, a CT scan is oftentimes performed in the radiology department after the procedure to confirm the placement of the electrodes. This necessitates transporting the anesthetized patient which is challenging for medical staff and may increase patient risk due to longer anesthesia times and repeated repositioning.

Our solution: more information in less time
ARTIS pheno provides intra-operative 2D imaging in addition to stereotactic guidance. This live imaging can help the surgical team advance the electrodes toward the planned location in the brain. Fusing syngo DynaCT with pre-operative MR images also allows for immediate confirmation of results after the procedure. Using ARTIS pheno in the Hybrid OR for intra-operative 3D assessment eliminates the need for transporting the patient back to the radiology department for another CT scan, saving approximately 90 minutes of time. As a result, anesthesia time is reduced, additional repositioning is avoided, and the hospital can schedule additional cases to increase OR utilization.

ARTIS pheno highlights
• Fusion imaging with pre-operative MRI and CT for outstanding image guidance
• syngo DynaCT for immediate 3D quality control of electrode placement in the OR
• Wide-space C-arm for comfortable intra-operative imaging, even when using head clamps and stereotactic frames
• Integration with nexaris Therapy Suites for multimodality approaches

Therapy challenges
More and more elderly patients – especially those with osteoporosis – are suffering from so-called fragility fractures. A viable minimally invasive alternative to conventional open fixation surgery (which involves large wounds and long hospital stays with complication risks) is percutaneous iliosacral screw insertion. It is challenging, however, to insert a screw using a long corridor – from the skin through the soft tissue and into the correct trajectory in the iliosacral corridor, all the way to the contralateral side – without injuring the important nerves and arteries.

Our solution: more precision
ARTIS pheno enables surgeons to perform precise iliosacral joint fixation. The system permits planning of the screw pathway using intra-operative 3D images and provides live guidance fluoroscopy by way of 2D. The final control of the results with syngo DynaCT takes only 4 seconds. In some cases, this minimally invasive approach permits the patients to walk again within one day after surgery.

ARTIS pheno highlights
- syngo DynaCT Large Volume for visualizing the complete pelvis to control symmetry
- syngo Needle Guidance with Automatic Path Alignment function for planning and guiding multiple screw insertions
- Integration of surgical tables
- Integration of navigation systems
- Antimicrobial C-arm coating, and floor-mounted design that keeps the ceiling free, for maintaining the highest infection control standards
Abdominal surgery

Perfecting minimally invasive liver cancer treatment with procedural intelligence

Therapy challenges
Image guidance in abdominal surgery is a relatively new field, but it creates new opportunities for curative treatment of patients with liver cancer. One of the most promising approaches available today is thermal ablation. Because ablation of tumors larger than 3 cm requires multiple precisely positioned needles, additional guidance equipment is indispensable.

Our solution: better guidance
ARTIS pheno provides integrated 3D planning and navigation tools for visualizing needle progression and achieving precise placement of multiple needles. CT or MRI datasets can be fused with intra-operative fluoroscopy to provide additional information about sensitive structures during the procedure. Choosing minimally invasive approaches for liver cancer treatment can reduce the length of patients’ hospital stays and reduce complication rates compared to open surgery.

ARTIS pheno highlights
- syngo DynaCT Large Volume for 3D visualization of large organs in the abdomen based on the actual situation in the OR
- syngo Needle Guidance for guiding ablation systems precisely to the target
- syngo Embolization Guidance for selectively embolizing structures
- Fusion imaging with MRI and CT for visualizing important anatomical landmarks
- Integration with nexaris Therapy Suites for multimodality approaches

On account of certain regional limitations of sales rights and service availability, we cannot guarantee that all products included in this brochure are available through the Siemens sales organization worldwide. Availability and packaging may vary by country and are subject to change without prior notice. Some/all of the features and products described herein may not be available in the United States.

The information in this document contains general technical descriptions of specifications and options as well as standard and optional features which do not always have to be present in individual cases.

The statements by Siemens’ customers described herein are based on results that were achieved in the customer’s unique setting. Since there is no “typical” hospital and many variables exist (e.g., hospital size, case mix, level of IT adoption), there can be no guarantee that other customers will achieve the same results.

The customers cited are employed by an institution that might provide Siemens product reference services, R&D collaboration or other relationship for compensation pursuant to a written agreement.

Siemens reserves the right to modify the design, packaging, specifications, and options described herein without prior notice. Please contact your local Siemens sales representative for the most current information.

Note: Any technical data contained in this document may vary within defined tolerances. Original images always lose a certain amount of detail when reproduced.

Not all features shown in this brochure are necessarily standard and available in all countries. Brainlab, Trumpf, and Maquet products are not sold by Siemens. They have to be ordered, installed, and serviced by way of separate contracts with the vendor in question.

For accessories, go to: siemens.com/medical-accessories

The statements with footnotes in this document are based on a result of the quoted clinical study that evaluates the procedure. The results are not generated with the actual product version. It is expected, that the actual product version has similar or improved functionality to support the evaluated procedure.

7 Advanced Robotic Angiography Systems for Image Guidance During Conventional Transarterial Chemoembolization Impact on Radiation Dose and Image Quality, Vogl, Thomas J., MD; Alizadeh, Leona S., M.D; Maeder, Richard, MS; Naguib, Nagy N., MD; Herrmann, Eva, PhD; Bickford, Matthew W., BS; Burk, Iris, MD; Albrecht, Moritz H., MD Investigative Radiology: March 2019 - Volume 54 - Issue 3 - p 153–159.
8 Shorter anesthesia time and less risk of necrotic tissue due to unperfused areas (A), reduced risk for patients with renal insufficiencies (B), fewer early reinterventions (C) lead to lower complication rates overall.
