Rising cost pressure, staff shortages, increasing amount of complex data, and decentralized work environments: strong trends are forcing transformation in the healthcare sector – and your IT platforms must keep up. Our Radiology Information System (RIS)¹ is a patient centric imaging workflow solution with integrated modules for patient administration, examination, reporting, statistics, and system administration. The enhanced features in our proven Radiology Information System can help improve diagnostic accuracy and enable healthcare providers to expand precision medicine.

**Personalized user modules** can provide appropriate information to the right user, at the right time. The team no longer needs to search for patient information because they have standardized, enterprise wide access to data.

Enhanced serviceability through active server monitoring which actively detect and correct system issues and minimize downtime.

**Forget paper – go mobile.** Full application and interactive documents are available on mobile devices. You can even create an IDOC for patient consent and have your patient sign forms on your tablet. This lets you focus more time on the patient, and less on technology interruptions.

Plus: Modules like the Screening Workflow Navigator² are also available on a tablet, and this module enables proper reimbursement for your screening programs.
