

7 signs you need help with population health management

How do you know you're on the right path to value-based care transformation? Here are seven signs that might indicate you could use some help with your value-based care or population health management strategy.

1

You don't know where to start

Look at your existing technology, care pathways, and resource investments. Determine what you need to optimize these to best care for your population.

2

You have an EHR to manage your population, and you think that is enough

Leverage the data in your EHR and connected HIT with population health or value-based diagnostic solutions that are designed for care collaboration between providers and patients.

3

You might be missing key diagnostic data

Did you know that approx. 35% of incidental findings that require follow-up do not receive it?¹⁾ Enhance patient outcomes by closing these care gaps.

4

You aren't getting the ROI you expected

Sometimes, software alone isn't the answer for value-based care transformation. It may also require changing your workflow, clinical practice or workforce structure.

5

You have a patient leakage problem

Enhance patient experience, for example, with a referrals management solution or by keeping patients engaged through regular communication.

6

Your readmission rates are affecting your bottom line

The leading cause could be a lack of patient compliance or a gap in care. Implement targeted patient outreach campaigns aligned with quality and care initiatives.

7

You don't have enough staff or time to engage with every single patient

Consider an automated patient engagement solution with targeted campaigns to communicate with every single patient in your care community.
