Interrupting a Scan or Stopping the Scanner on Biograph

1. If you want to interrupt a topogram, CT, or PET scan in a non-emergency, press the HOLD button on the control box.

2. Another way is to click the SUSPEND button on the examination task card.

3. The scan is cancelled, and the protocol will move to the next step.

4. To restart the aborted protocol step (topogram, CT or PET), right click on the step and select REPEAT.

5. Press LOAD. The scan will start from the beginning.

6. The patient should be in the same position on the PHS to repeat the scan and for proper attenuation correction.
